

ABSTRACT

The present invention is a method for establishing and identifying a communication pair in a wireless AV system and provides a system in which notification is provided to a user in a case where a wrong pair that the user does not intend to establish among plural AV devices is established.

A wireless AV system is a wireless system comprising one or more transmission-side devices and one or more reception-side devices, each of the one or more transmission-side devices comprises means for issuing its own ID with respect to the one or more reception-side devices, the one or more reception-side devices comprising means for storing the ID received from a transmission-side device.
